²Huawei Theory Lab

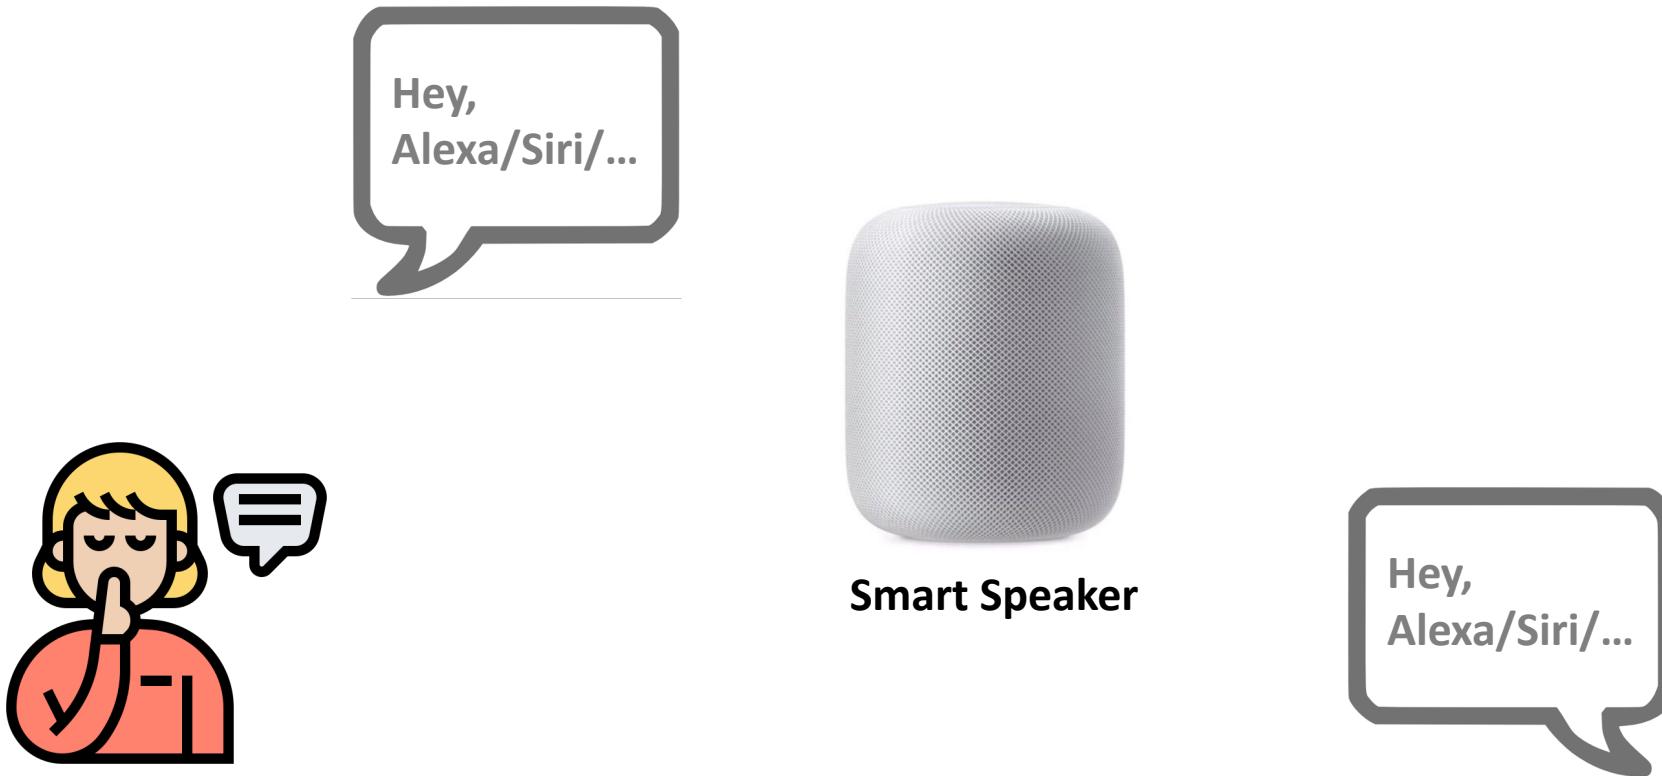

The Booming Smart Speaker Market

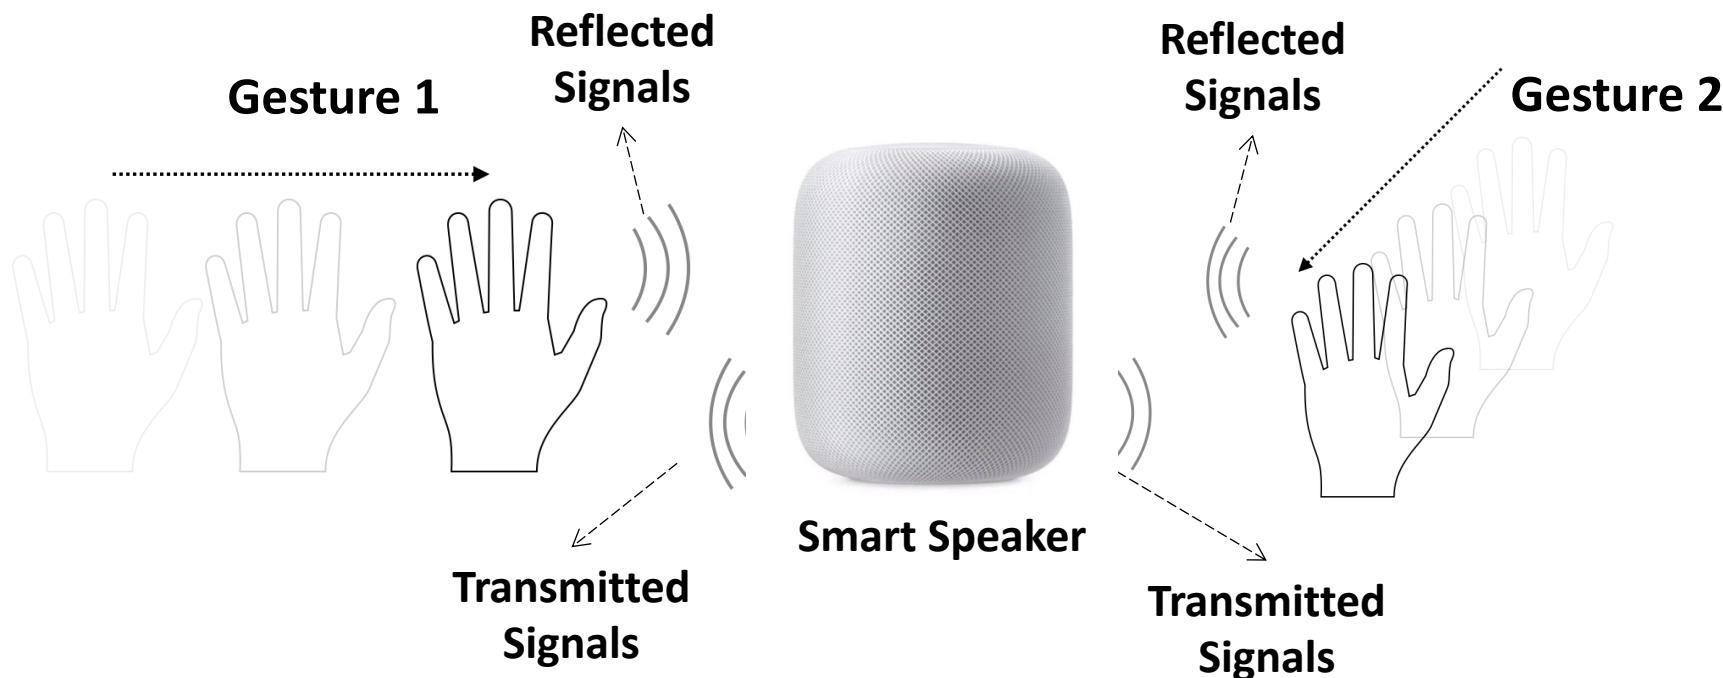

The global market is expected to reach \$17.85 billion in 2025

Interaction with Smart Speakers: Voice

Mandatory quiet areas and privacy concerns may limit the usage of voice interaction.

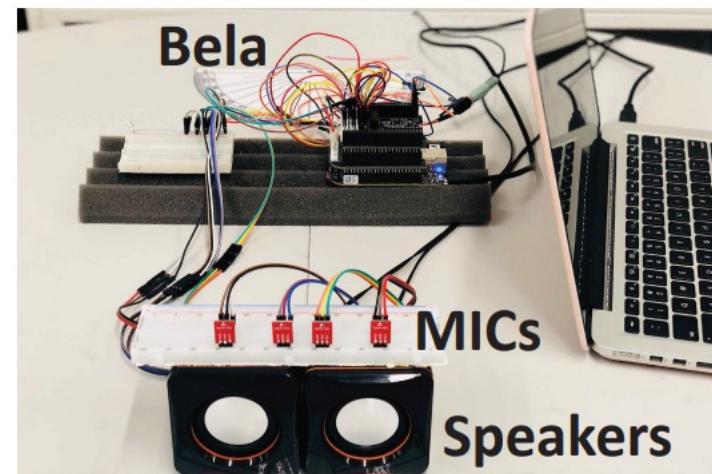

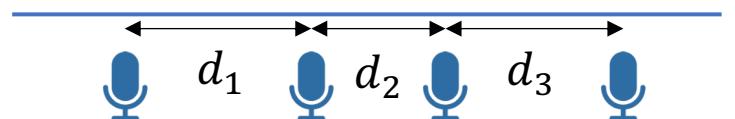

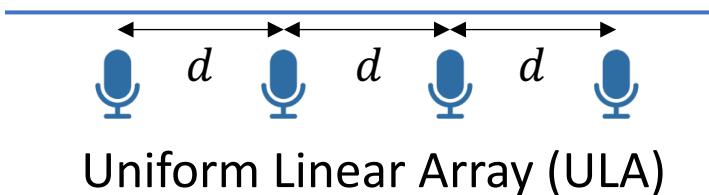

Interaction with Smart Speakers: Gesture

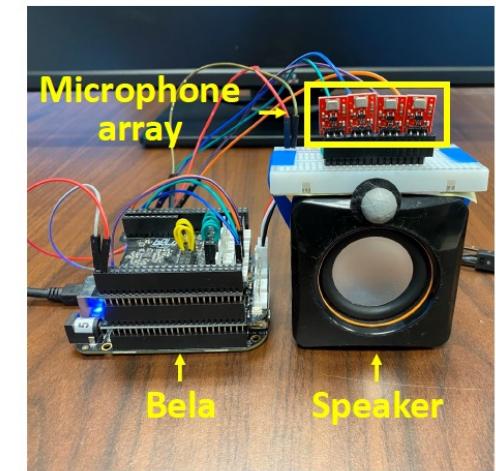

Repurpose the smart speaker as an active sonar to provide gesture-based interaction

Gesture Tracking on Linear Array

- Prior efforts have realized fine-grained acoustic-based gesture tracking on the uniform/non-uniform **linear microphone arrays**.

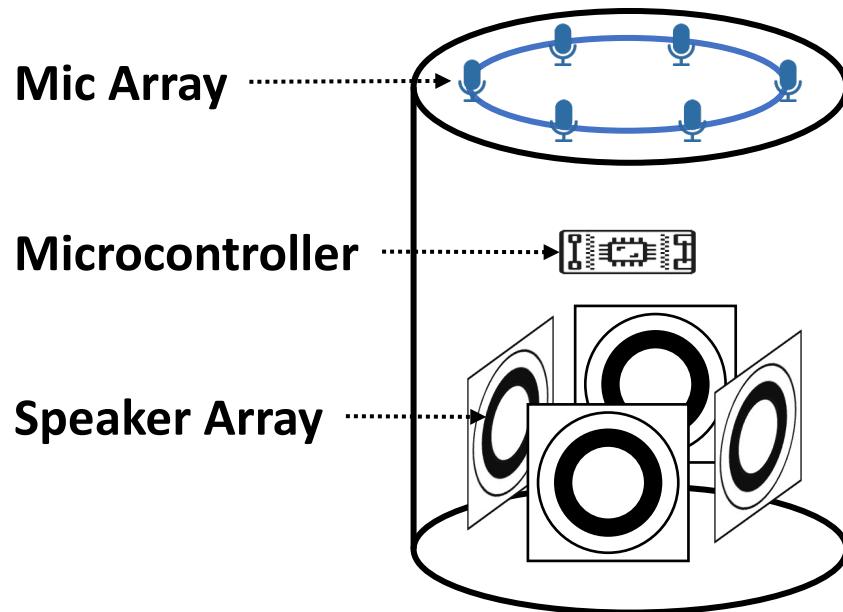

[Mobicom'19]

[Sensys'20]

Gesture Tracking on Uniform Circular Array

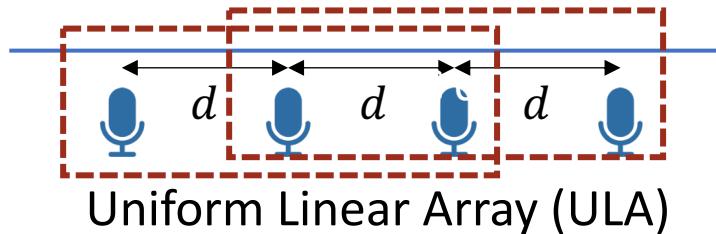

| Product | Mic Layout | Mic Spacing |
|-----------------|------------|-------------|
| Amazon Echo | 6-mic UCA | 4.96 cm |
| Amazon Echo Dot | 4-mic UCA | 7.00 cm |
| Apple Homepod | 6-mic UCA | 7.10 cm |
| Sonos One | 6-mic UCA | 5.99 cm |

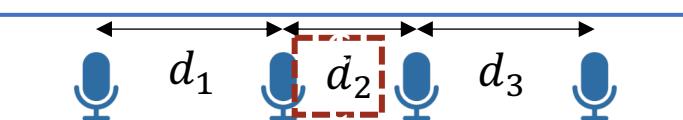

Uniform Circular Array (UCA) is the dominating array layout of most commercial products

Linear Array V.S. Circular Array

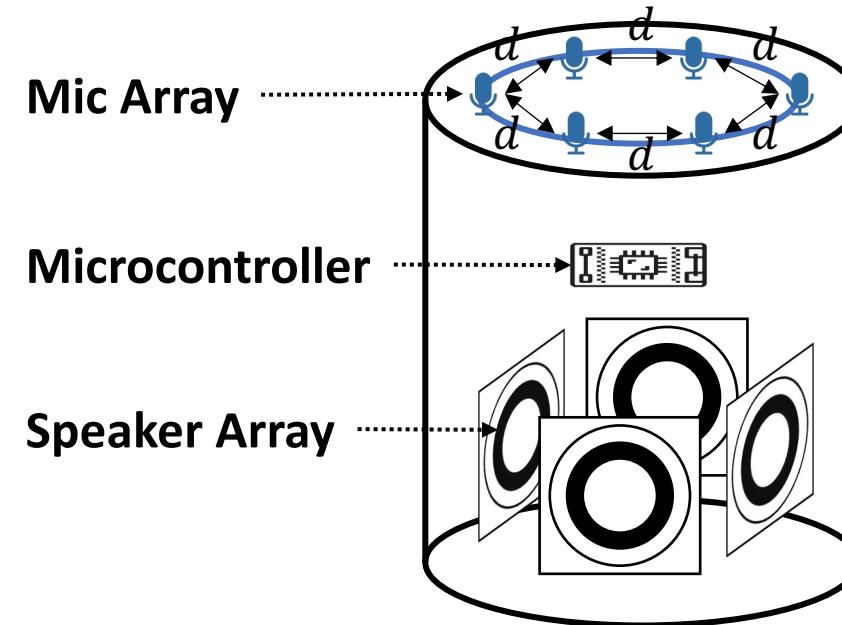

orientational invariant structure

a small separation to reduce aliasing

Non-Uniform Linear Array (NULA)

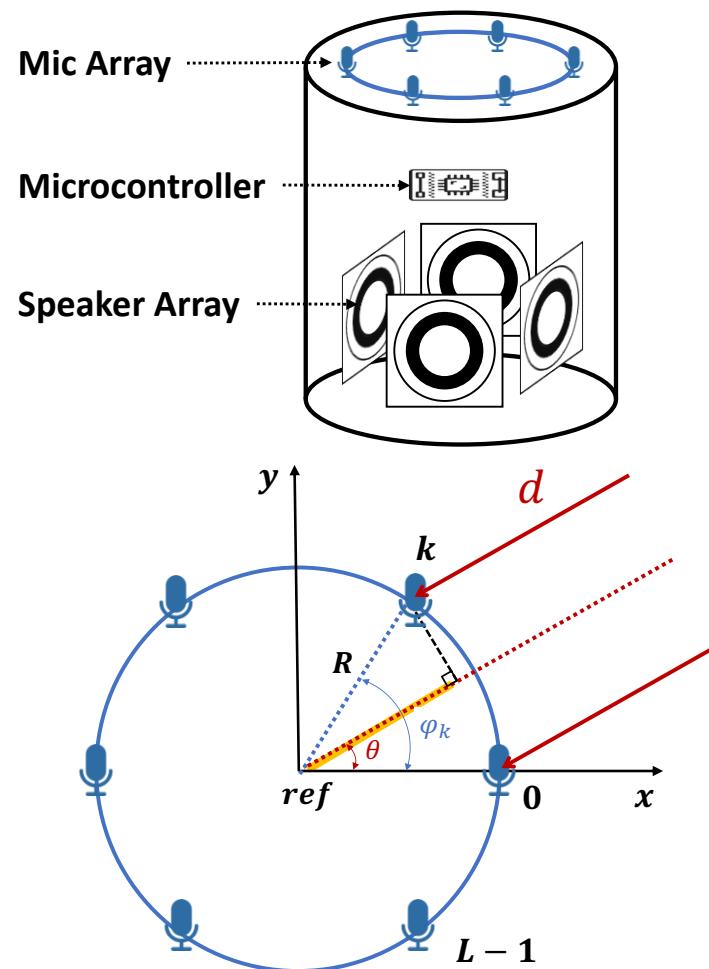

| | LA in prior studies | UCA of commercial smart speakers |
|------------------|--|---|
| Signal Coherence | orientational invariant structure apply spatial smoothing | lack orientational invariant structure |
| Spatial Aliasing | ultrasound-wavelength-level mic-spacing non-uniform array | several centimeters mic-spacing uniform geometry |

SparseTrack: Key Insights

- **Reflector Sparsity**
 - The number of significant moving reflectors that could have contributed to the overall reflected signal is limited
- SparseTrack treats multi-target gesture tracking from the **sparse recovery perspective**

Casting Gesture Tracking to Sparse Recovery

UCA Signal Modeling

Time domain waveform of candidate reflection positions (d, θ)

$$X = Dic \times C + \mathcal{N}$$

Measurement Matrix Sparse vector for true reflection positions
Noise

Sparse Recovery Formulation

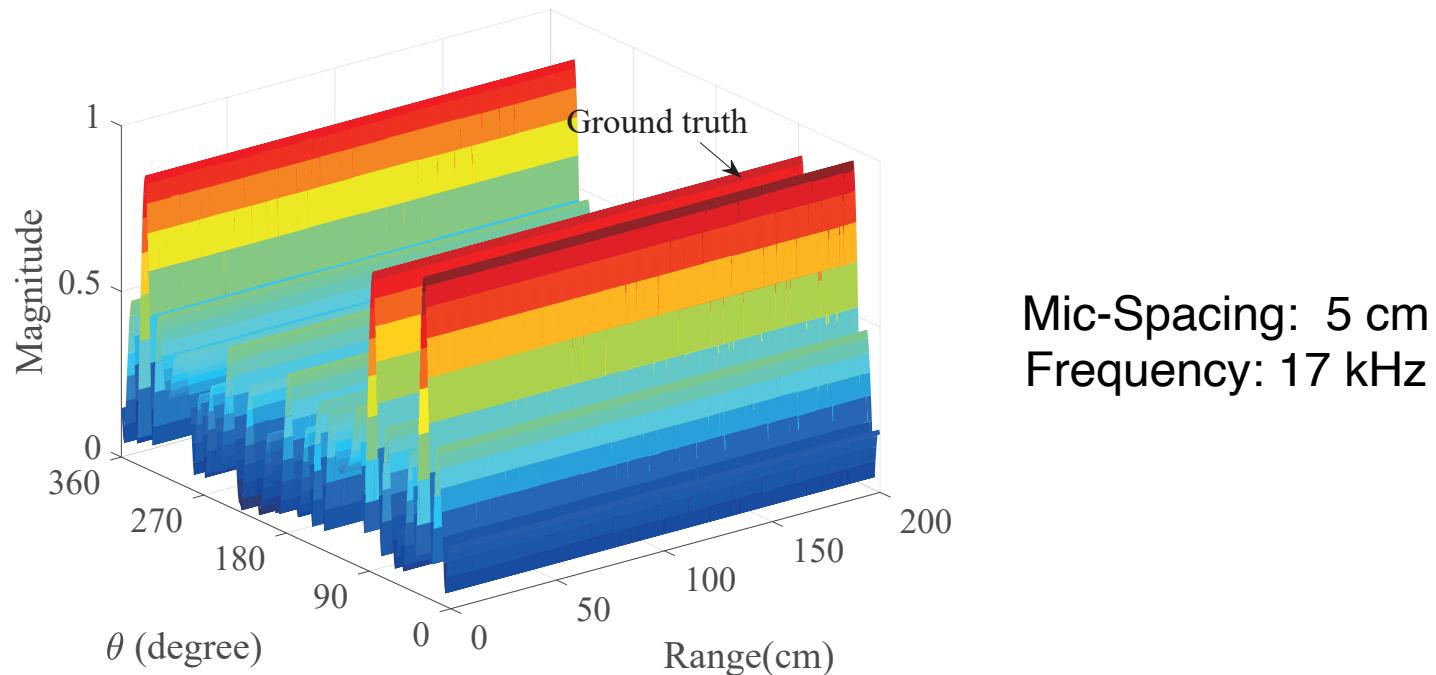

$$\min \| C \|_0 \text{ s.t. } \| X - Dic \times C \|_2 \leq \varepsilon$$

Find the smallest number of scaled and shifted reflection signals that could make up the overall signals received by the mic-array

Challenges & Solutions

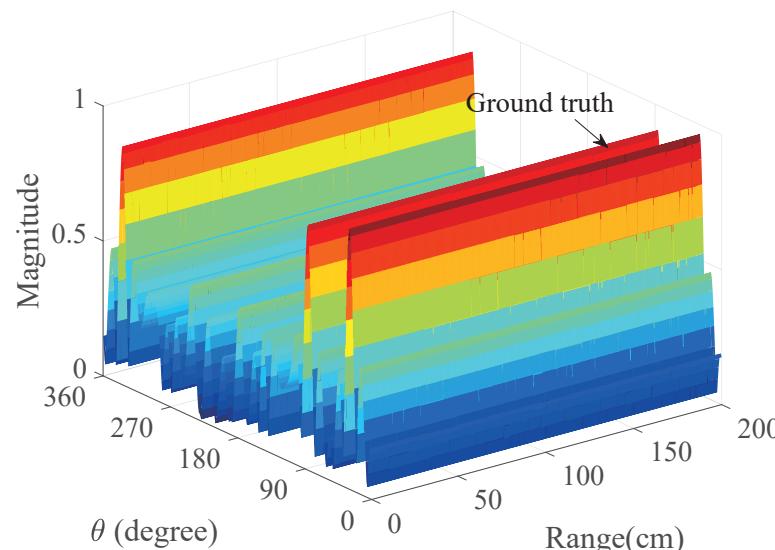

Challenge 1: Spatial Ambiguity

- Root cause: insufficient spatial sampling rate
 - Mic-spacing of commercial products: 5-7 cm
 - Wavelength of inaudible ultrasound (17-23 kHz): 1.5-2 cm
- Ambiguity issue exists in both range and direction domain.

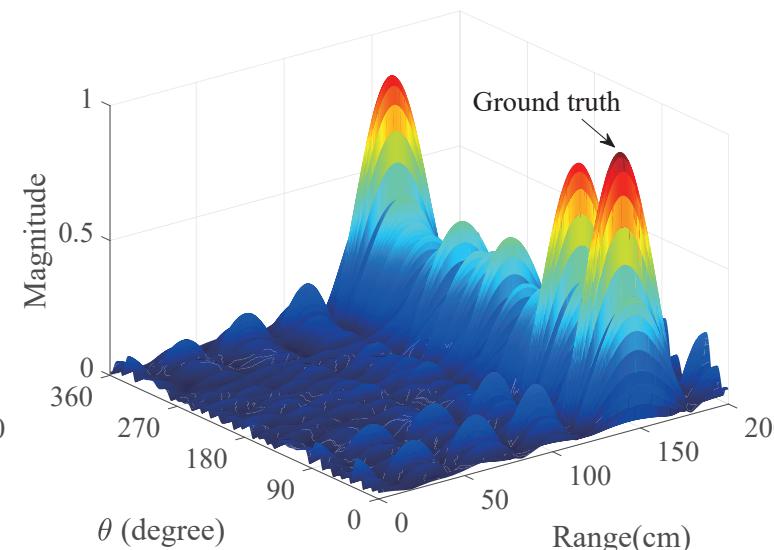

Solution: Synthesizing Wideband Measurements

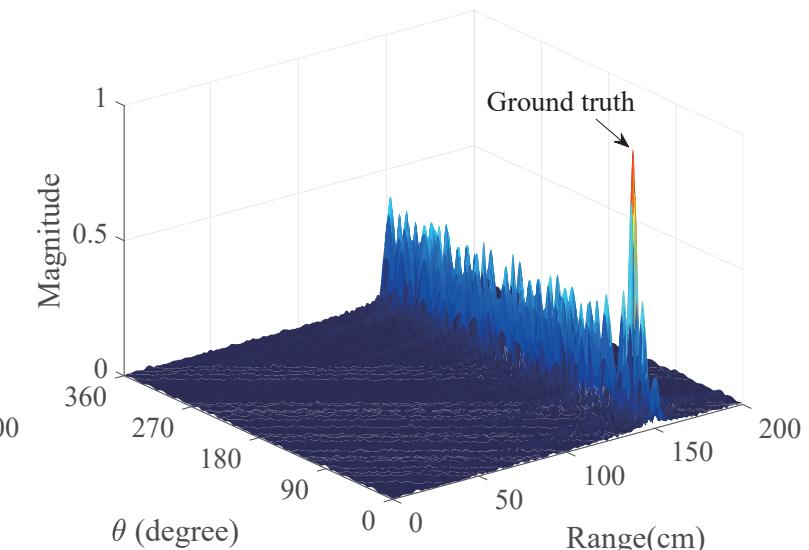

- Key observation: frequency diversity of the transmitted signal helps!
 - The measurement from each frequency component experiences different ambiguities, but all measurements include the positions of true reflectors.

Mic-Spacing: 5 cm
Frequency: 17 kHz

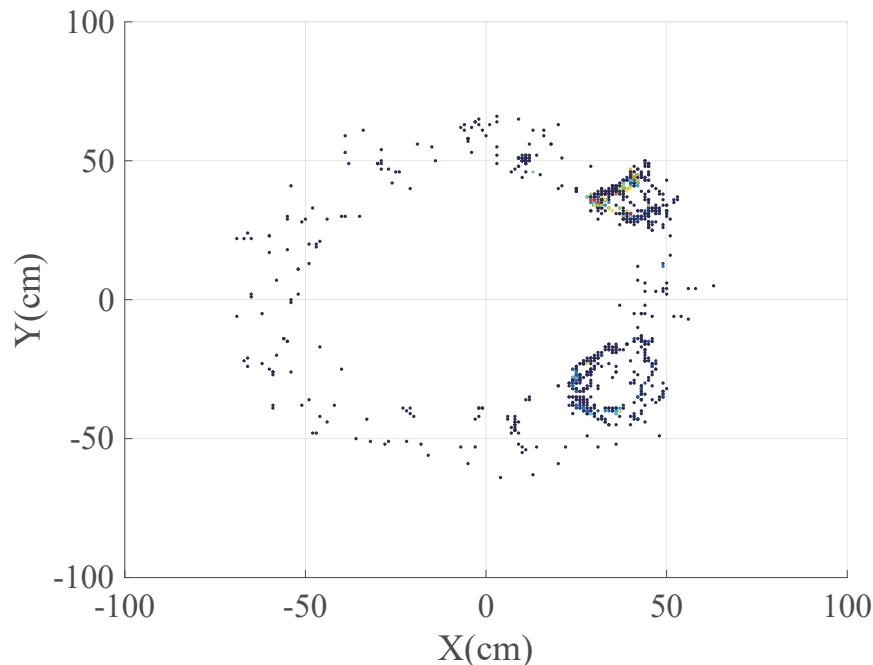

Mic-Spacing: 5 cm
Frequency: 17-17.5 kHz

Mic-Spacing: 5 cm
Frequency: 17-23 kHz

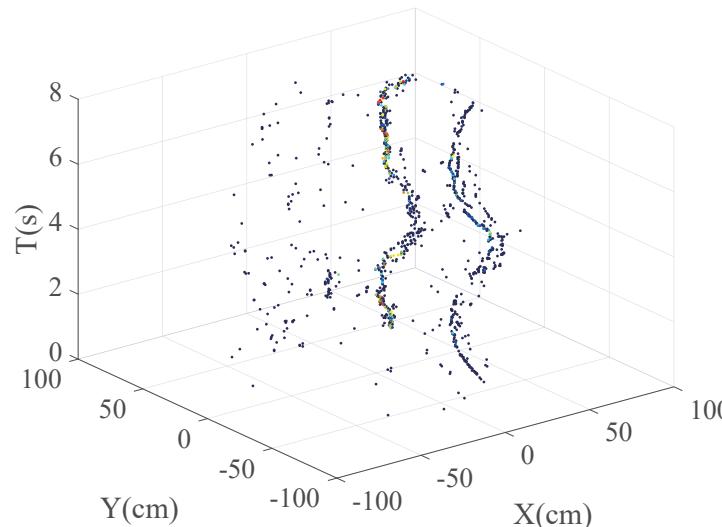

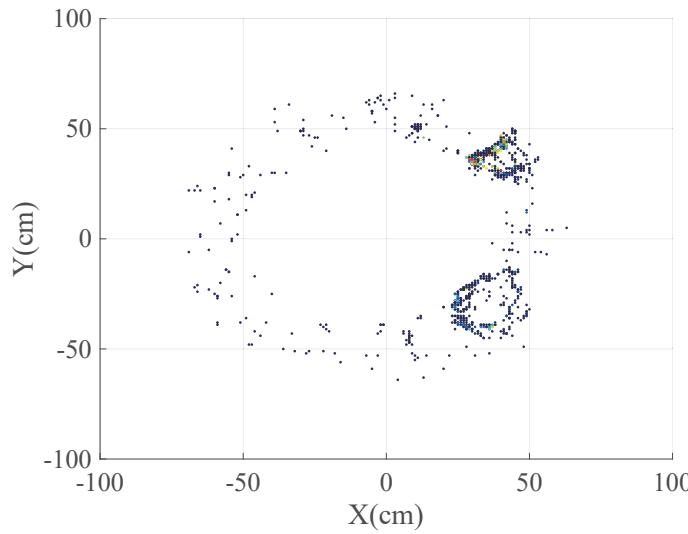

Challenge 2: Noisy Reflection Measurement

- The output of reflection localization is not noise-free.
- It is non-trivial to extract multiple gesture traces robustly.

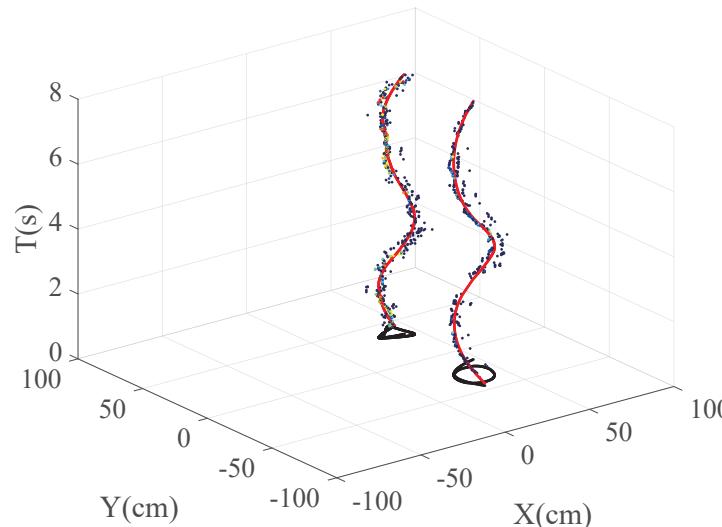

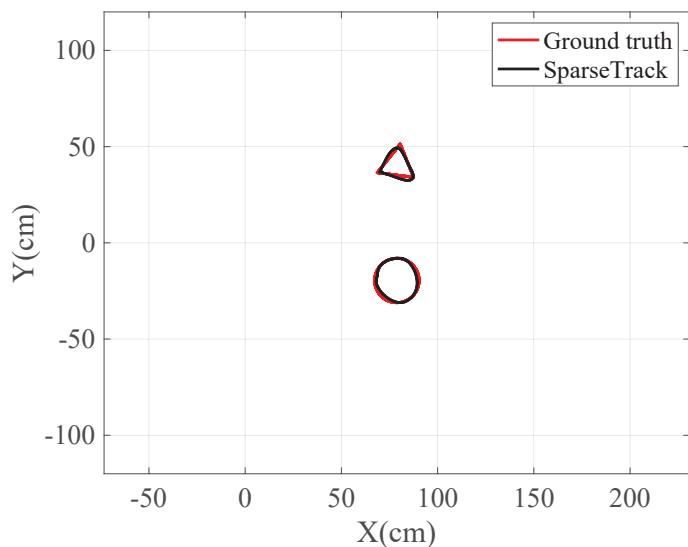

Two users are required to ‘draw a circle’ and
‘draw a triangle’ simultaneously.

Solution: Leverage Time-Domain Information

**Time Dimension
Expansion**

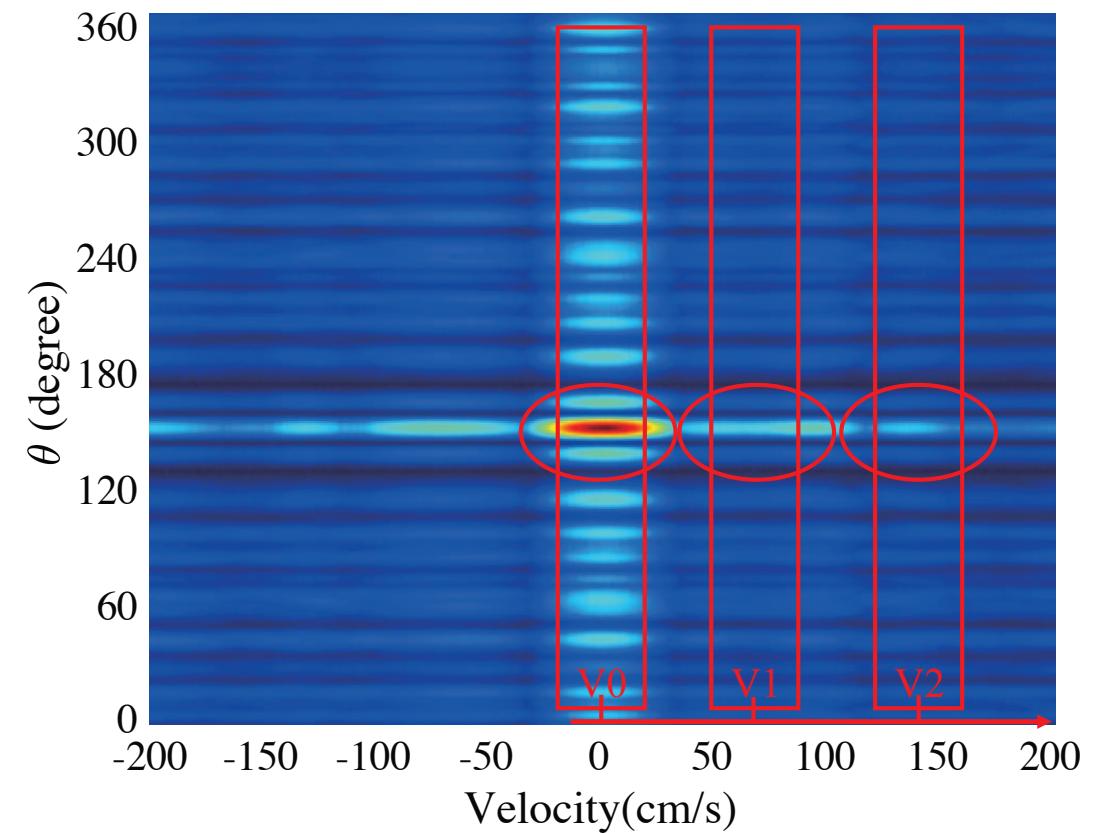

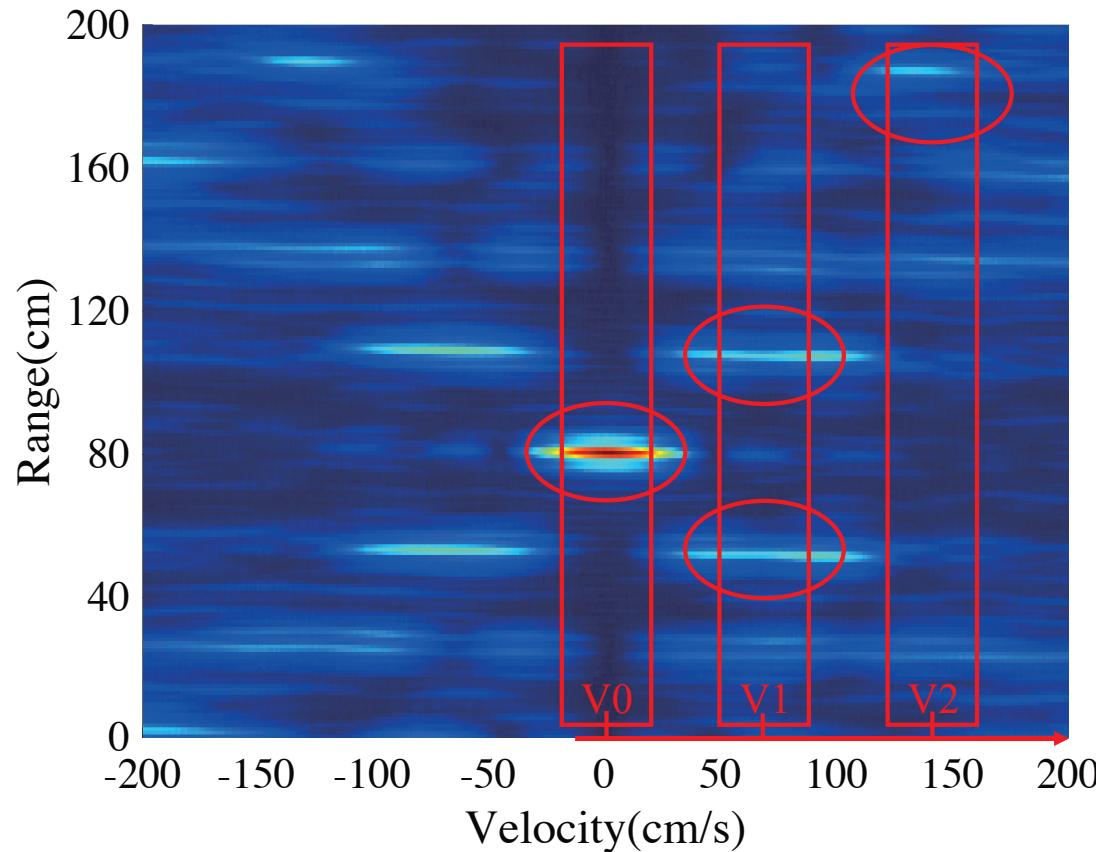

**Valid Trace
Identification**

**3D to 2D
Projection**

Challenge 3: Reflector Dynamics

- Doppler effect downgrades the performance of gesture tracking

Solution: Velocity-aware Dictionary

Time domain waveform of candidate reflection positions (d, θ)

$$X = Dic \times C + N$$

Measurement Matrix

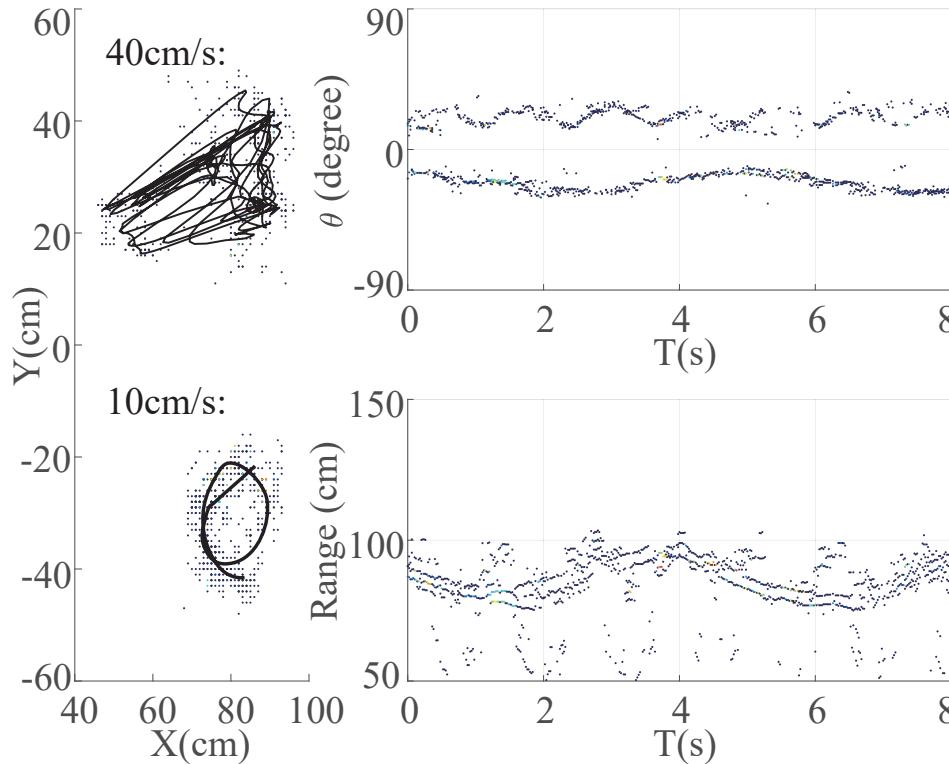

Sparse vector for true reflection positions

Noise

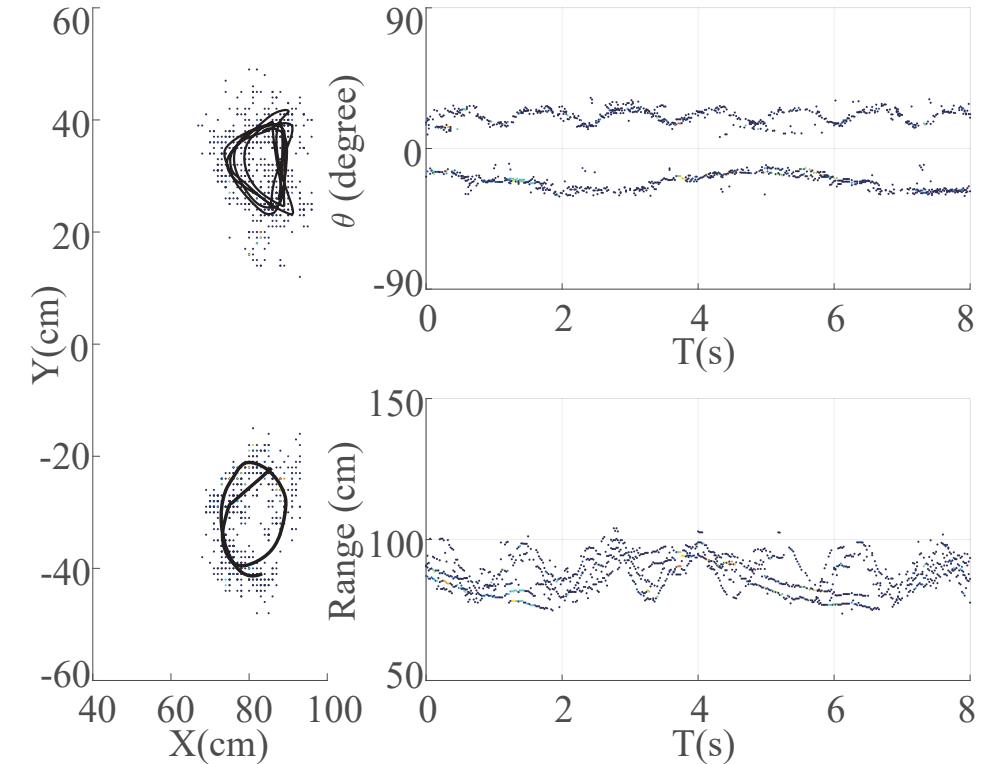

Velocity-aware Dictionary: (d, θ, v)

The diagram illustrates the mathematical model for signal acquisition. It shows the equation $X = Dic \times C + N$. The term X is labeled 'Measurement Matrix'. The term Dic is labeled 'Velocity-aware Dictionary: (d, θ, v) '. The term C is labeled 'Sparse vector for true reflection positions'. The term N is labeled 'Noise'. Arrows point from the labels to their respective components in the equation.

Solution: Velocity-aware Dictionary

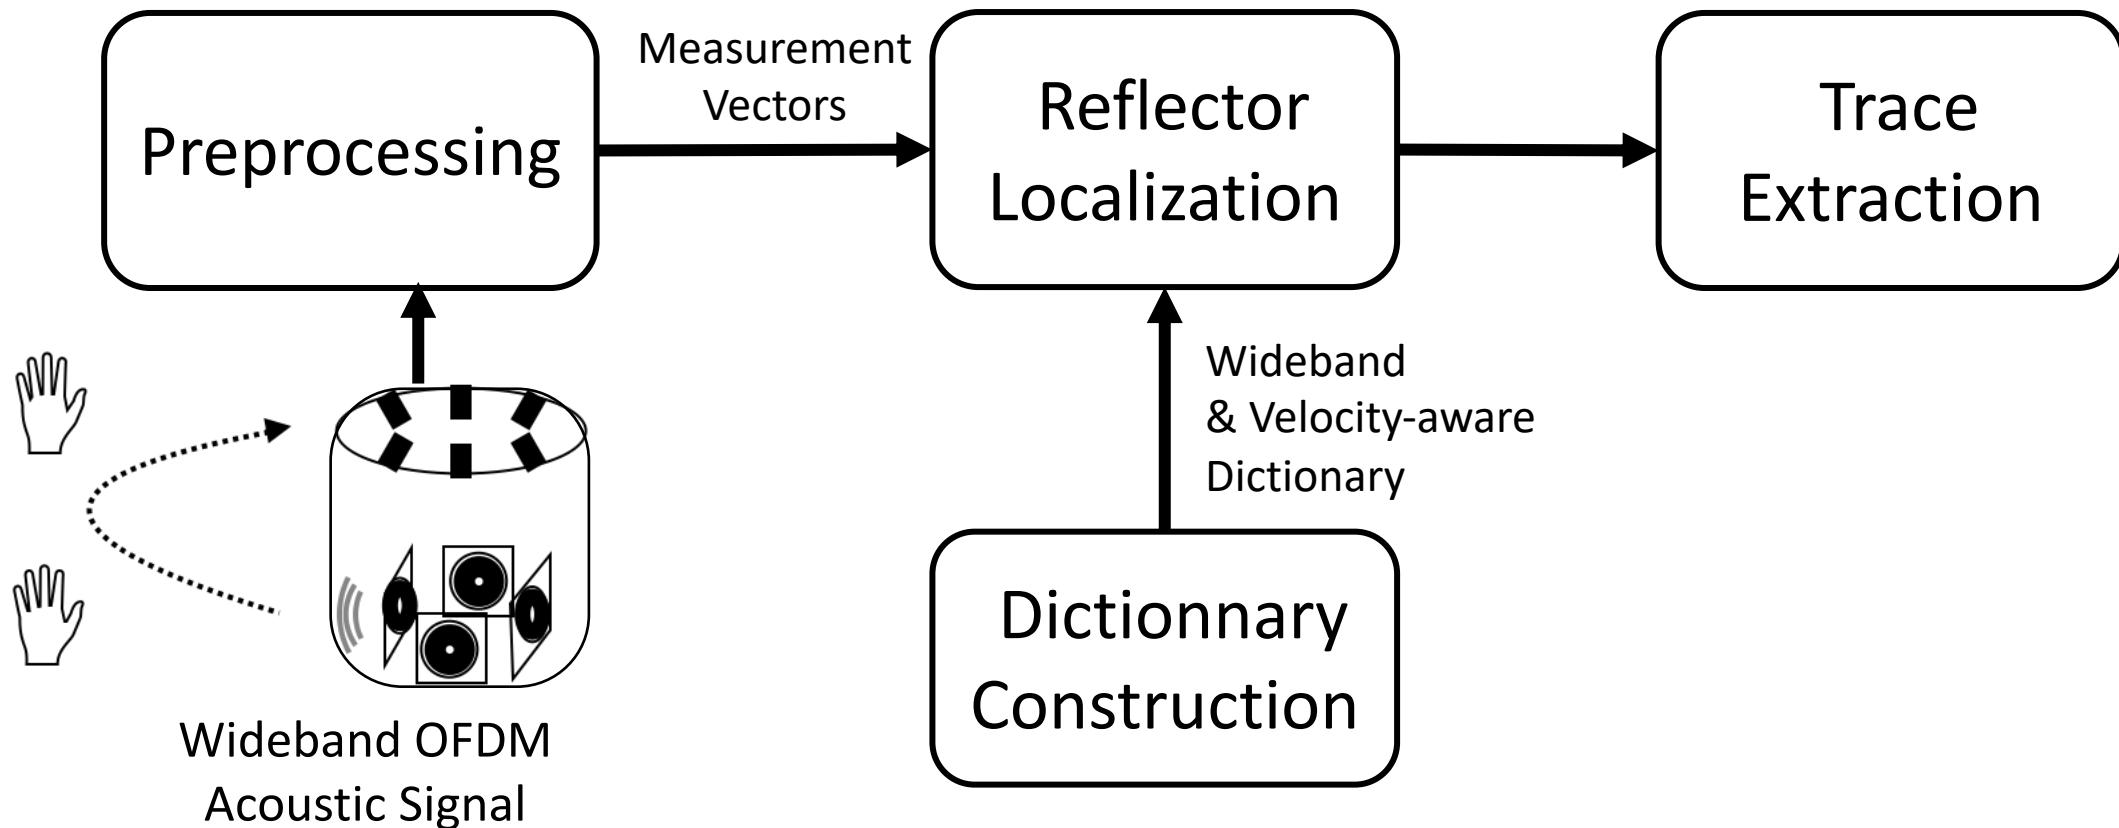

Without Velocity-aware Dictionary

With Velocity-aware Dictionary

SparseTrack: Putting All Things Together

Implementation & Evaluation

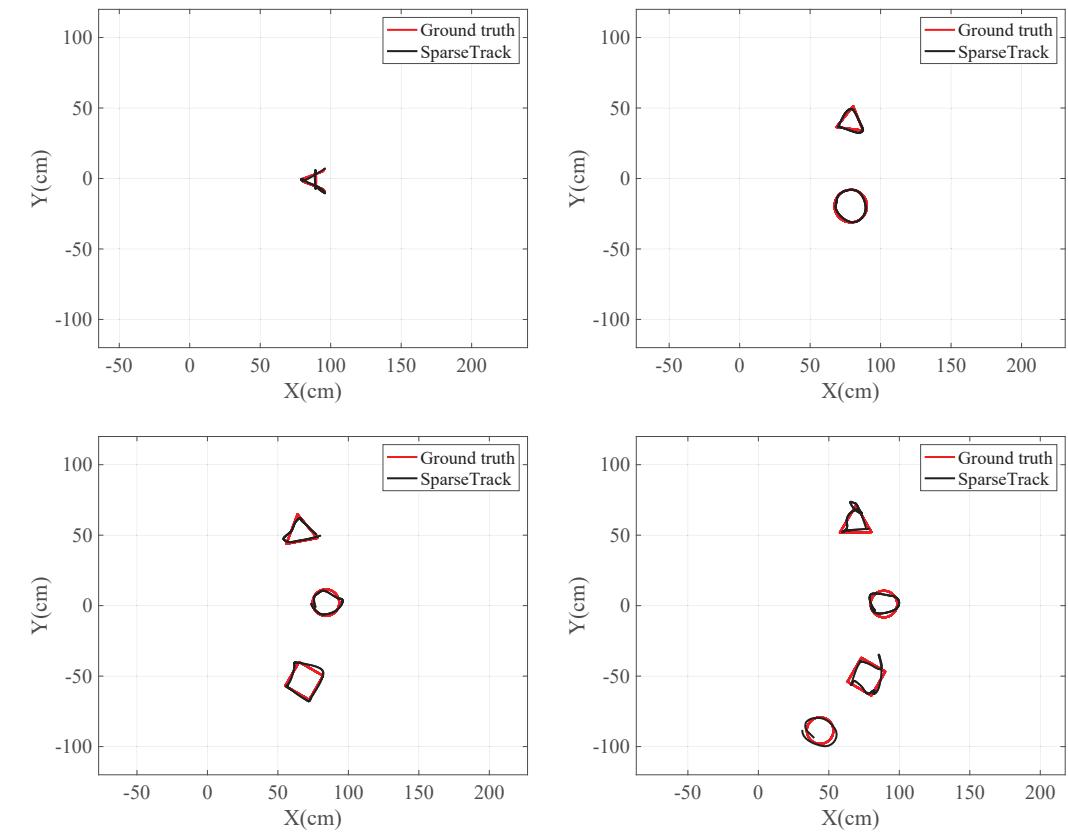

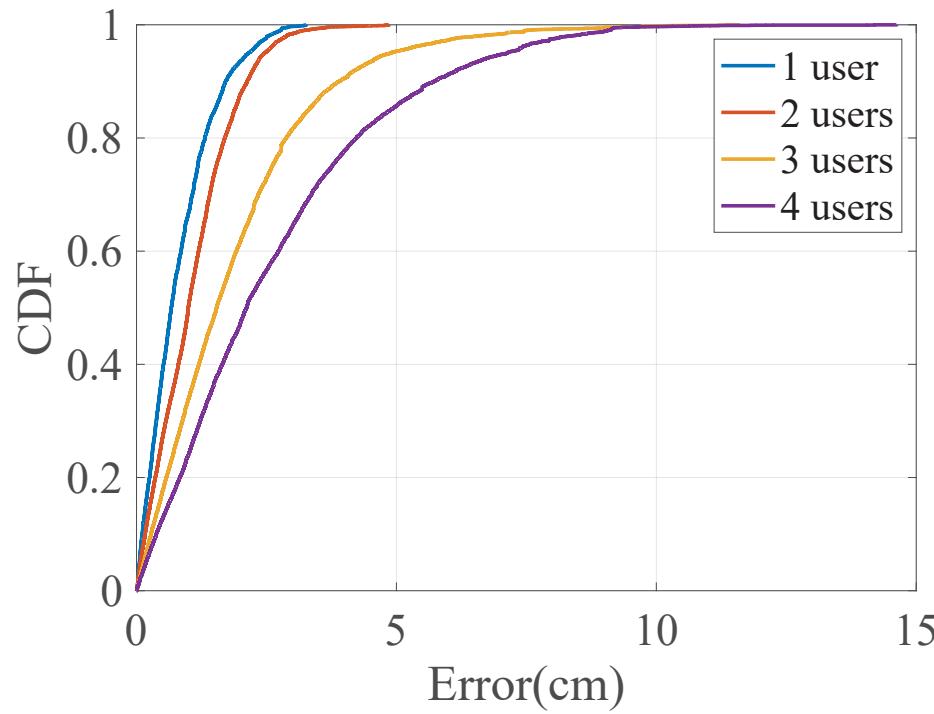

Evaluation Setting

- The prototype has a similar layout as commodity smart speakers:
 - 4 Edifier M1250 speakers + 1 ReSpeaker 6-Mic UCA with 4.7 cm spacing
- 167 collected traces in total under different conditions

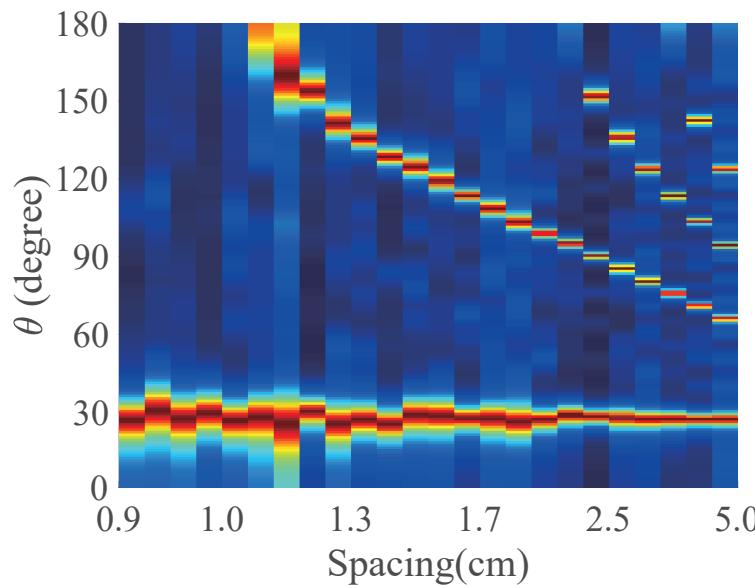

Evaluation: Overall Performance

- SparseTrack can simultaneously track 1 to 4 users' gestures
- SparseTrack achieves a mean tracking error of 2.66 cm

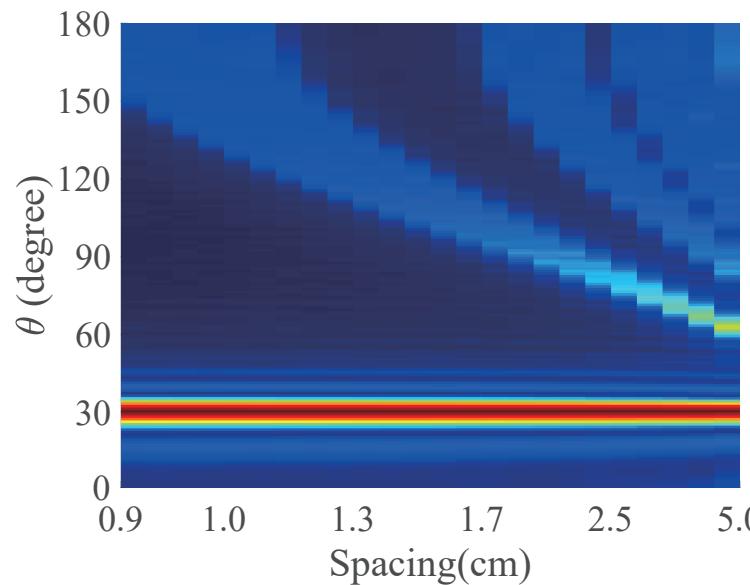

Evaluation: Handling Spatial Ambiguity

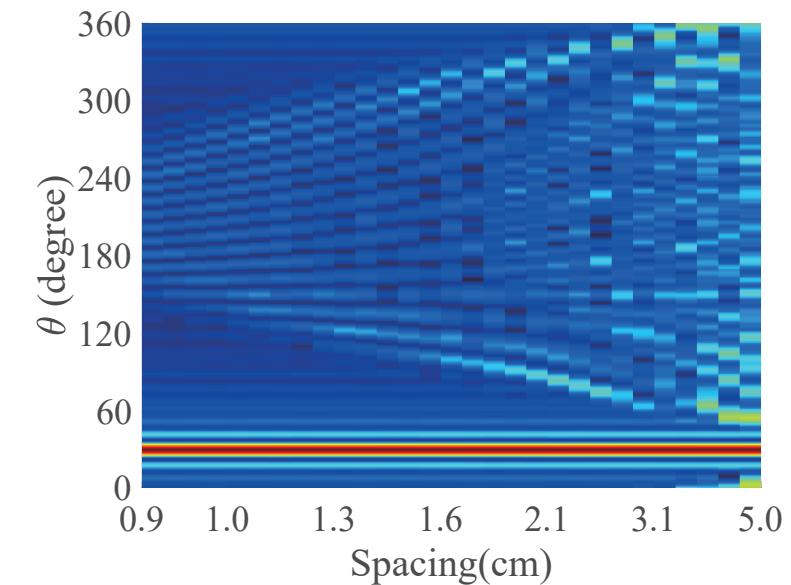

- SparseTrack can handle the spatial ambiguity issue even when the mic spacing is much larger than half of the wavelength.

2D MUSIC with ULA

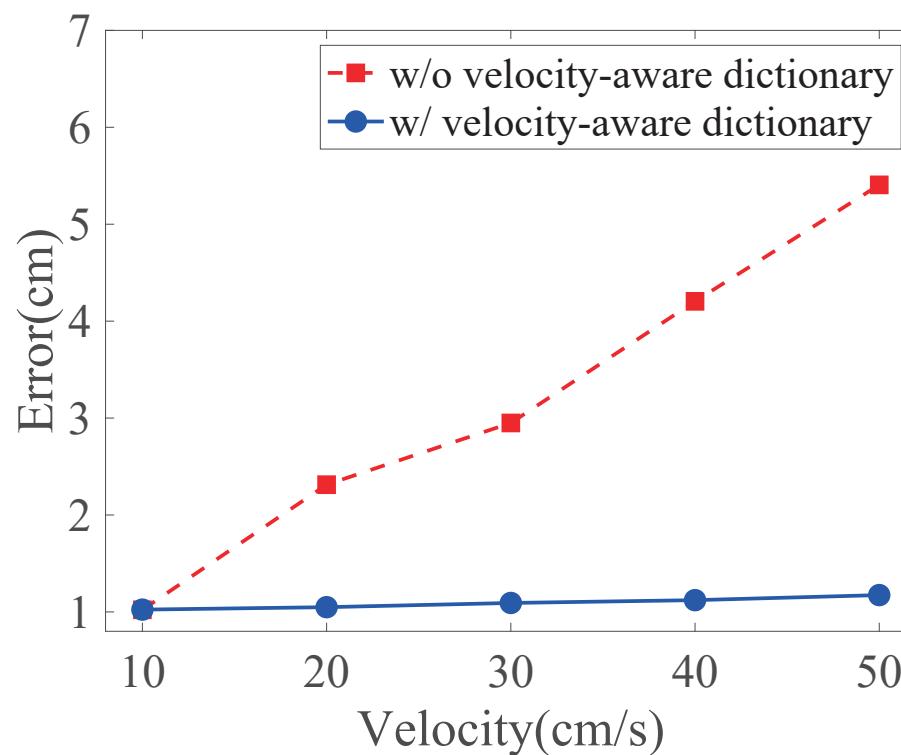

SparseTrack with ULA

SparseTrack with UCA

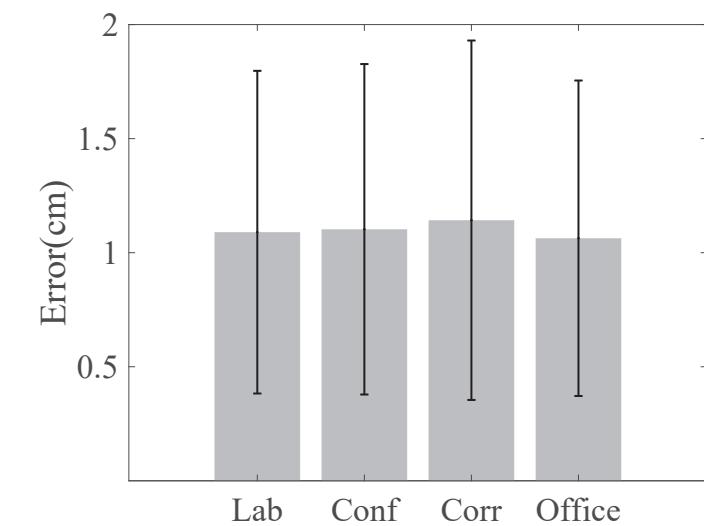

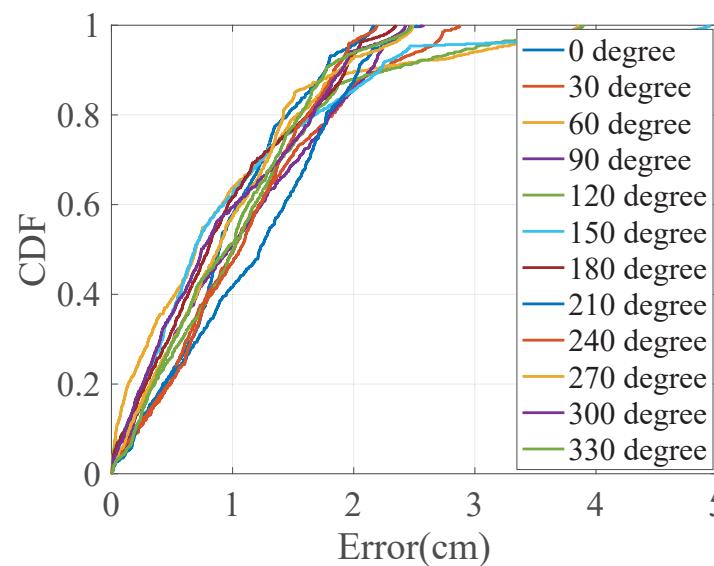

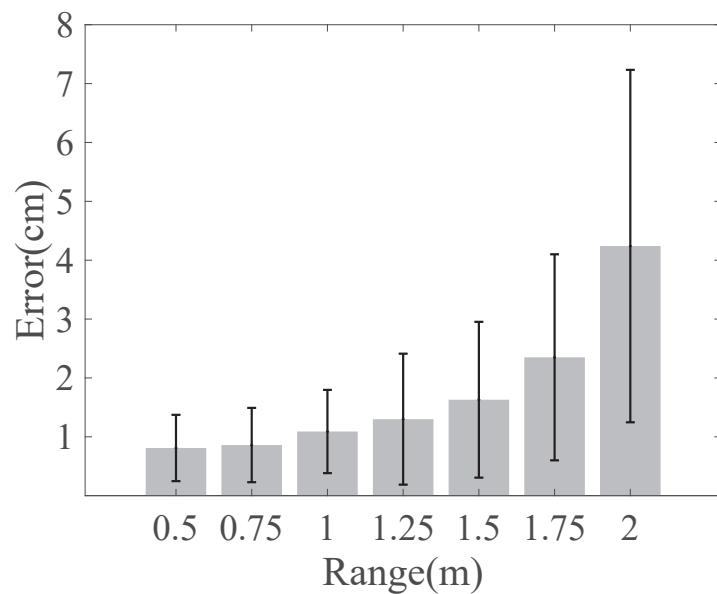

Evaluation: Handling Doppler Effect

- The velocity-aware dictionary successfully handles the Doppler effect and achieves stable performance.

Evaluation: Impact Factors

- Good tracking performance within the range of 1.5 m
- Robust performance under different directions and locations

Conclusions

- SparseTrack achieves fine-grained multi-user device-free gesture tracking on smart speakers with uniform circular geometry.
- SparseTrack takes a step to mature the gesture interaction on commercial products.

Thanks!
